

CMSE 202 - Spring 2019

Project Updates

In order to make sure that you finish your project on schedule, your team is going to give a very brief project update to the rest of the class. You'll present these project updates next week in class on April 1 (for Section 002) and April 2 (for Section 001). You should put together a small set of slides using Google Slides so that all of your group members can collaborate on creating them. You should also share your slides with your instructor using their `@msu.edu` email address. Your slides should include the following:

- The topic you've chosen to pursue for your project
- The question(s) you hope to answer related to this topic
- If applicable, the data you plan to use for your project
- The python packages you will need to use for your project
- A description of the progress you've made on your project thus far
- Any visualizations you've been able to make up to this point

Your group will only have **2 minutes** to share out these details -- make sure you have a plan for what you want to say!

As a reminder, here is the list of expectations for the group semester project from the semester project details document:

1. Define a question (or questions) that you think you can answer either by analyzing a publicly available dataset and/or by building/using a computational model.
2. Acquire any data necessary to pursue your question(s).
3. Identify any pre-existing python-based libraries or packages that can be used to aid in answering the question(s).
4. Familiarize yourself with the data/libraries/packages and make sure you're aware of their limitations.
5. Write the code necessary to run your model or analyze your data.
6. Present the results to the class in the form of a 10-15 minute talk with slides, plots, code, etc.
